

Rihla+

YOUR HEALTH, **ORGANIZED.**
YOUR QUESTIONS, **PREPARED.**

Rihla+ Product Case Study

Building Rihla+: An AI-Powered Healthcare Companion

Using the PARR Framework (Problem • Approach • Result • Relevance)

Problem

Managing personal healthcare remains fragmented and stressful.

Patients often juggle multiple patient portals, paper prescriptions, laboratory reports, imaging results, appointment notes, and medication lists across different providers.

Before appointments, many struggle to remember when symptoms began, how they've changed over time, or which questions they wanted to ask.

As a result:

- Medical history becomes difficult to communicate accurately.
- Healthcare appointments become less efficient.
- Important health information is easily overlooked.
- Patients feel overwhelmed rather than empowered.

Existing healthcare applications primarily focus on storing information, but few help patients **understand**, **organize**, and **actively use** that information throughout their healthcare journey.

Approach

To address this challenge, I designed and developed **Rihla+**, an AI-powered healthcare companion that transforms fragmented medical information into a structured, chronological, and intelligent health journey.

The product was designed around one guiding principle:

Healthcare should feel organized—not overwhelming.

Instead of treating healthcare as isolated events, Rihla+ treats it as a continuous journey.

Core product capabilities include:

Personal Health Profile

A centralized profile containing:

- Medical conditions
- Allergies
- Medications
- Healthcare providers
- Emergency contacts

Health Timeline

A chronological timeline allowing users to record:

- Symptoms
- Doctor visits
- Medication changes
- Treatments
- Personal health notes

This creates a living medical history rather than disconnected records.

Secure Document Vault

Users can upload and organize:

- Lab reports
- Neurology consultations
- Prescriptions
- Imaging reports
- Medical documents

Everything remains searchable and available before appointments.

AI Health Assistant

Responsible AI helps users:

- Summarize health history
- Explain medical terminology
- Review medications
- Generate appointment summaries
- Prepare discussion points for healthcare providers

Every AI response includes:

Educational only. Not medical advice.

Appointment Companion

One of the platform's key innovations is helping users prepare before meeting their doctor.

Instead of remembering everything manually, Rihla+ automatically reviews recent symptoms, medications, uploaded documents, and previous appointments to generate an organized appointment brief.

Health Insights

AI analyzes health trends over time by identifying patterns in symptoms, treatments, medication adherence, and appointments.

This helps users better understand their own healthcare journey while supporting more informed conversations with providers.

Result

The result is a modern healthcare platform that combines thoughtful UX, secure data management, and responsible AI into one cohesive experience.

Users can now:

- Organize their complete healthcare history.
- Track symptoms over time.
- Prepare confidently for appointments.
- Store medical records securely.
- Generate AI-powered educational summaries.
- Visualize health trends and progress.

Rather than simply digitizing medical records, Rihla+ helps users become active participants in managing their health.

From an engineering perspective, the application also demonstrates:

- Modular architecture
- Responsive design
- Secure authentication
- Row Level Security
- AI integration
- Scalable component design
- Modern React development practices

Relevance

Although Rihla+ is demonstrated using a fictional migraine management journey, its architecture extends beyond healthcare.

The platform showcases reusable product capabilities including:

- Timeline management
- AI-powered assistance

- Secure document management
- Analytics dashboards
- Notifications
- User authentication
- Modular component architecture

These building blocks can be adapted across industries such as:

- Education
- Finance
- Human Resources
- Retail
- Legal Technology
- Real Estate
- Logistics
- Wellness

Rihla+ therefore represents more than a healthcare application—it demonstrates a reusable AI product architecture capable of supporting multiple domains.

For **Numuv Labs**, it reflects a broader vision of designing secure, human-centered platforms that combine thoughtful user experience with responsible artificial intelligence.

Key Takeaways

Problem

Healthcare information is fragmented, making it difficult for patients to stay organized and prepared.

Approach

Develop an AI-powered platform that centralizes health records, visualizes the health journey, and provides educational AI assistance while prioritizing security and usability.

Result

A scalable web application that helps users organize their health information, prepare for appointments, and gain meaningful insights through AI.

Relevance

The underlying architecture is reusable across multiple industries, demonstrating platform thinking, modular engineering, and product design beyond healthcare.

Project Highlights

Category	Details
Role	Product Manager, UX Designer & Full-Stack Developer
Duration	Built as an end-to-end AI product prototype
Product Type	AI-Powered Healthcare Companion
Tech Stack	React, TypeScript, Tailwind CSS, Supabase, PostgreSQL, OpenAI
Focus Areas	Product Strategy, UX/UI Design, AI Integration, Secure Data Management
Key Principles	Human-Centered Design, Responsible AI, Privacy by Design, Modular Architecture
